

# Biogas from Energy Crops and Biowastes

Charles Banks  
University of Southampton

# Acknowledgements - Current project

**Acronym:** CROPGEN

**Title:** Renewable energy from crops and agrowastes

**Contract:** SES6-CT-2004-502824

**Duration:** 1 March 2004 – 28 February 2007

**Total cost:** 2.5 M€ **EC funding:** 2.1 M€

**website:** [www.cropgen.soton.ac.uk](http://www.cropgen.soton.ac.uk)

# Old technology - new application

- The technology of biochemical methane generation is well established
- Traditionally it has been used for waste stabilization
- Current focus is on energy production
- To be cost-effective in this role may require
  - engineering and technical improvements to increase conversion efficiencies
  - Selection and production of biomass feedstocks from a variety of sources
    - including novel and multi-use crops and agro-wastes from integrated farming systems, commercial and industrial wastes and by-products.

# Anaerobic digestion in its simplest form

- Closed reactor
- System of gas collection
- Production of biogas
- Production of digestate

# Product and Energy use

# Process types

Wet

Dry

One stage

Multi-stage

Mesophilic

Thermophilic

# Process differences

## *Wet Process*

- less than 15 % feedstock solids concentration
- one or several stages
- usually operate at 35°C
- requires water addition or recycle
- larger reactor
- proven technology for sewage sludge digestion
- more applicable to co-digestion with other waste

## *Dry Process*

- more than 15% feedstock solids concentration
- usually one stage
- can operate at 35°C or 55°C
- minimal water addition
- smaller reactor
- becoming most popular choice for MSW
- more data and reference plants needed

# Instantly recognisable!

**Wet digester**

*mesophilic*

**Dry digester**

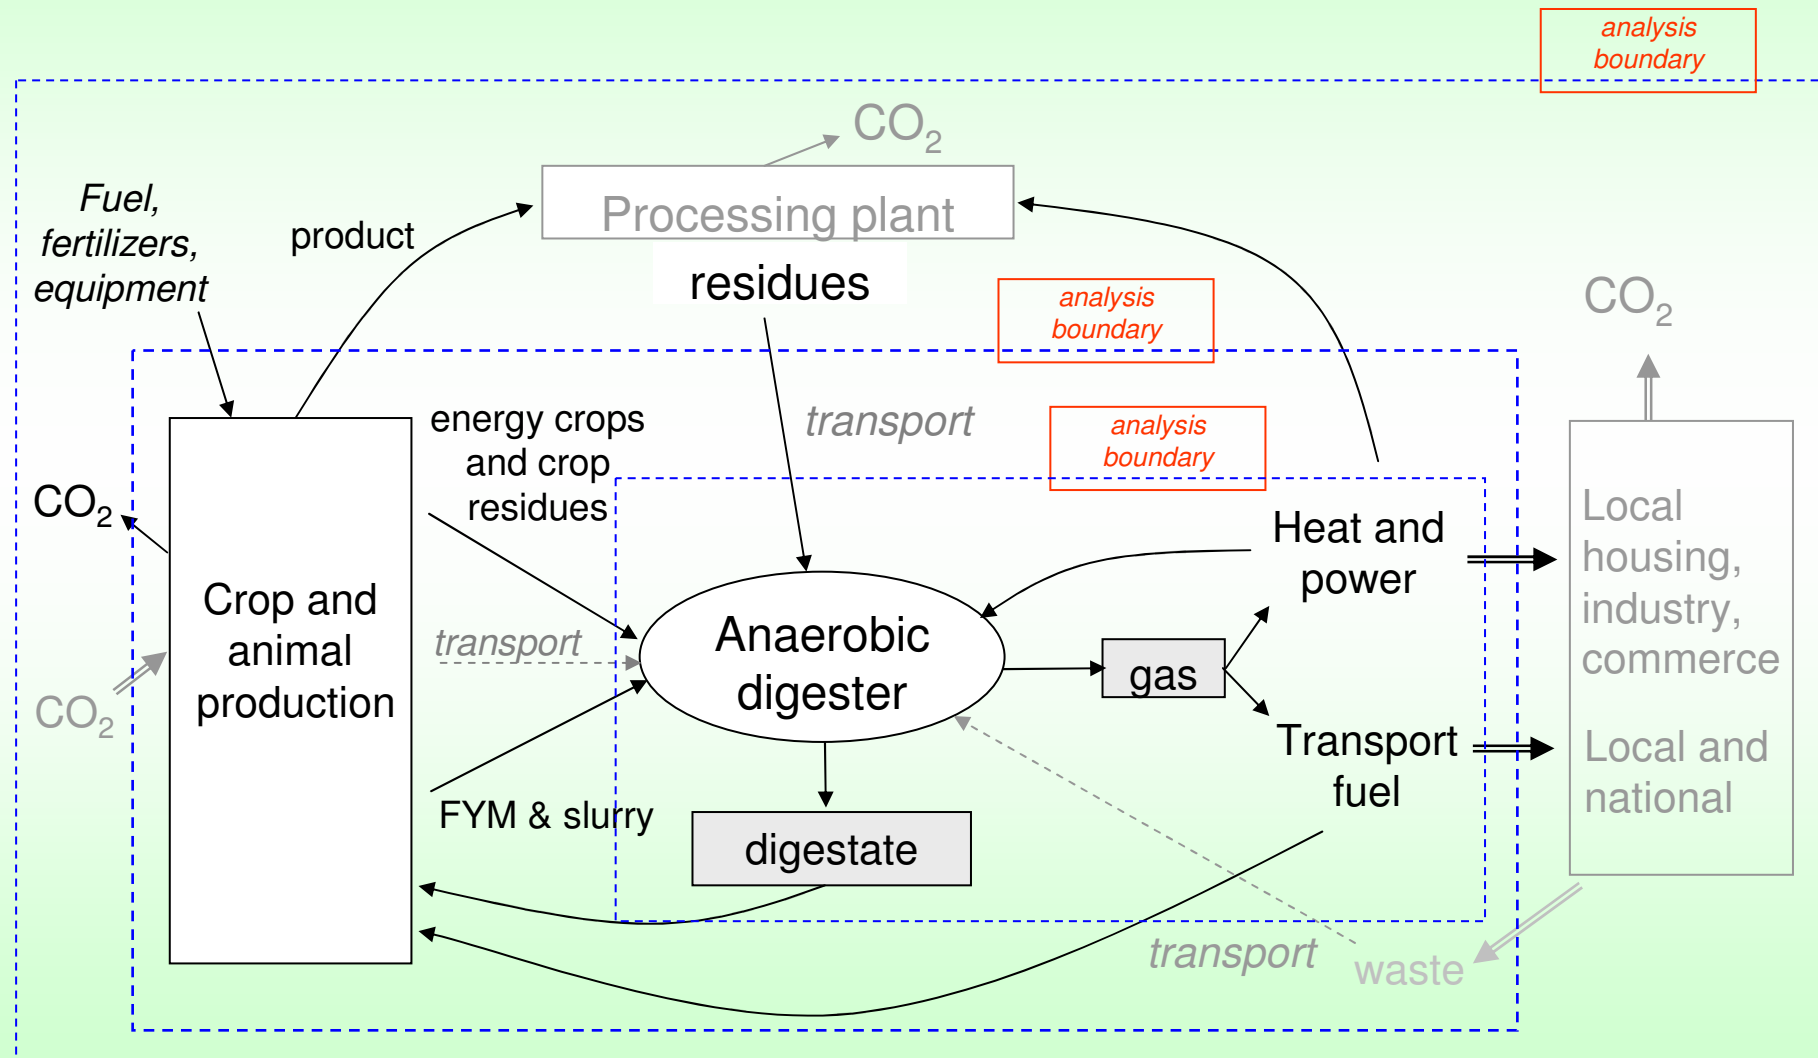

*thermophilic*

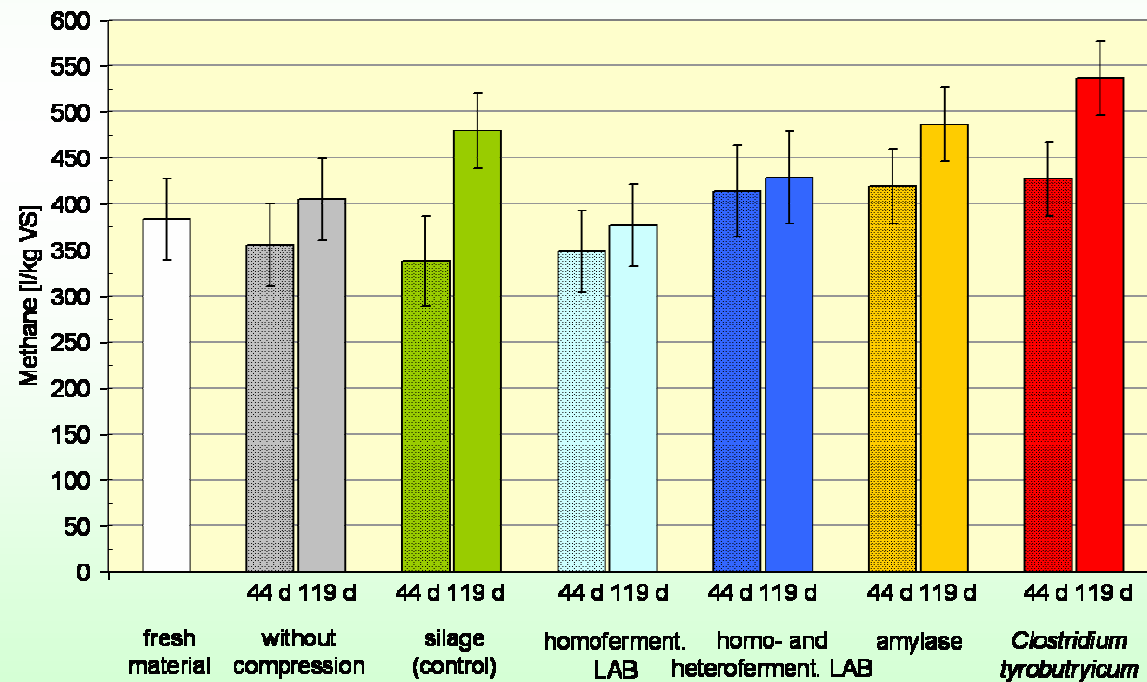

**Dry digester**

# Biogas as a renewable energy source

# Results: storage and pretreatment

- Some potential to increase methane production by alkaline and water-based pre-treatments, and certain spoilage organisms.
- More important, poor treatment or storage conditions reduce biogas yields.

# Digestion trials

- Single phase digestion trials on a wide range of substrates at laboratory and large scale providing valuable design data

*Pilot plant trials for crops and agro-wastes*

# Results: single phase digestion trials

- Single phase digestion trials on a wide range of substrates at laboratory and large scale providing valuable design data

*Volumetric and specific gas yields per kgVS. Trend lines based on 50-day average.*

# Phase separation innovations

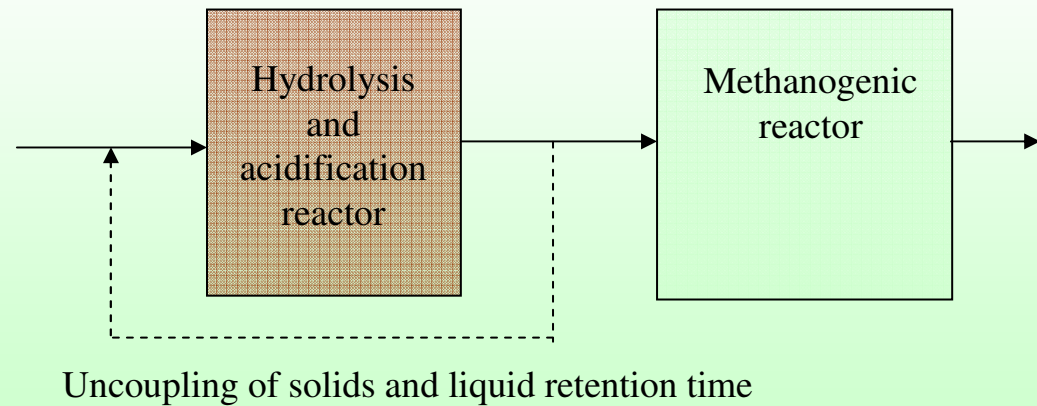

## Permeating beds

## Plug flow reactors

## Two phase systems (coupled and uncoupled)

# Permeating bed reactors

- Single bed systems using grass and maize have given poor results even with pH control
- Permeating bed with second stage high rate methanogenic reactors gives greater potential for stable operation and biogas production
- May be some potential for certain crop types but preliminary results indicate that overall process efficiency is likely to be poorer than for single phase mixed reactors
- Potentially an interesting mix of fermentation products

# Plug flow systems

R2 VFA profile and gas production  
Day 1

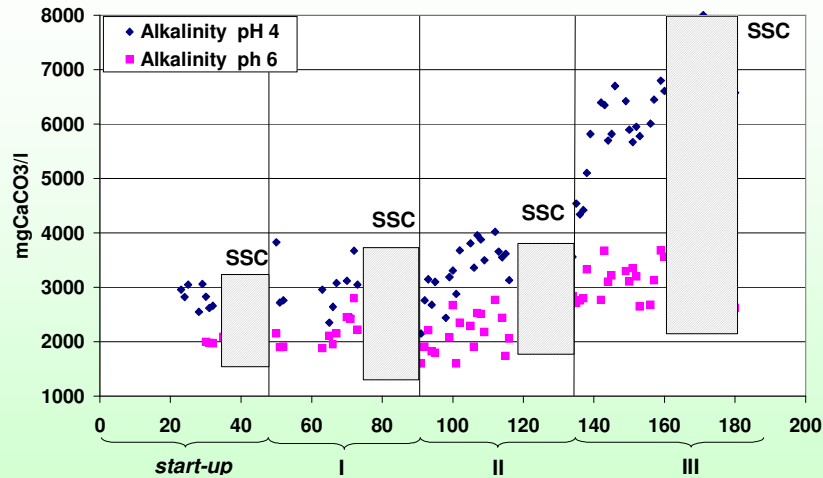

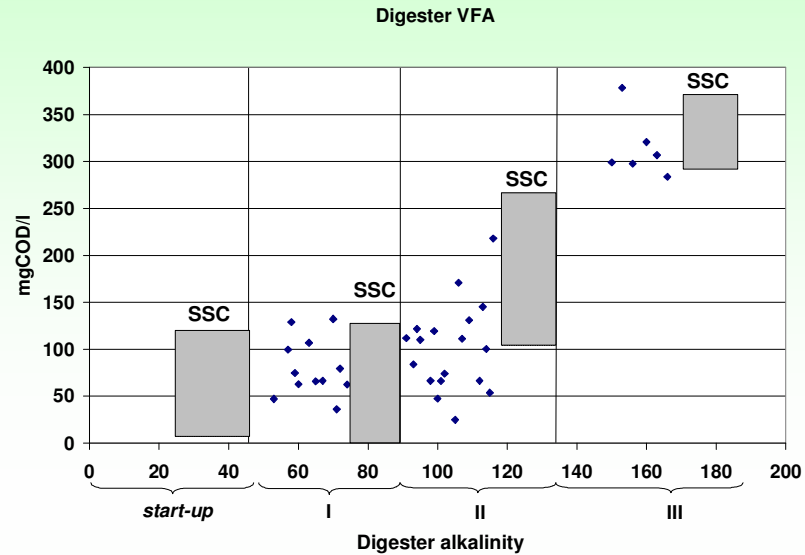

R2 VFA profile and gas production

- Result from a high initial loading in the reactor
- Plug flow may limit the overall loading that can be achieved
- Give an interesting gas and acid production profile ( $H_2$ )
- May have potential for certain waste types and the concept could be further exploited for refined fuel production and biorefinery intermediates
- Still to explore very high solids systems with high recycle rates

# Two phase systems

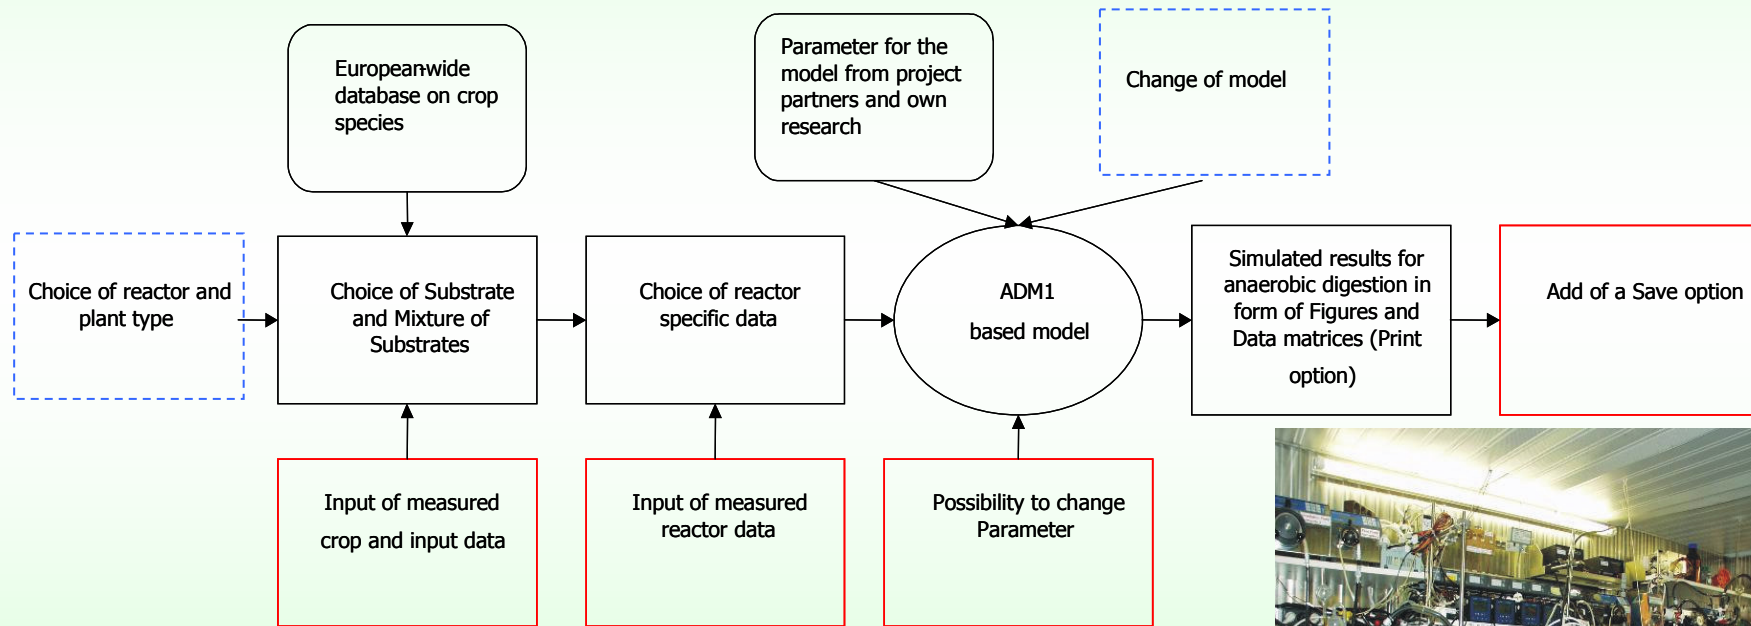

- Overall performance for the treatment of market wastes at thermophilic temperatures and the loading used shows no advantage in process stability or performance compared to single phase controls

- Uncoupling of solids and liquids retention time in a first phase mixed reactor using maize as a substrate failed to improve rates of hydrolysis and solids destruction

# Process modelling

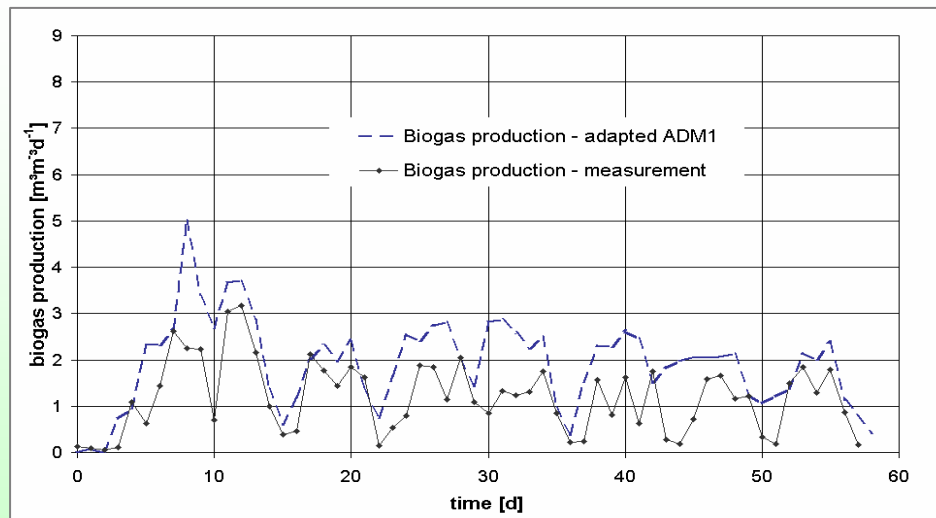

- The anaerobic digestion model 1 (ADM1) has been adopted as a basis for the establishment of:
  - Virtual Laboratory
  - DSS

# Results: process modelling

Preliminary results with original ADM1. The model follows the course of the experiment, but the correlation is too low for practical application

Adjusted model after first manual calibration ( $k_{hyd} = 1 \text{ d}^{-1}$ )

# Energy models

Record: 1 of 5

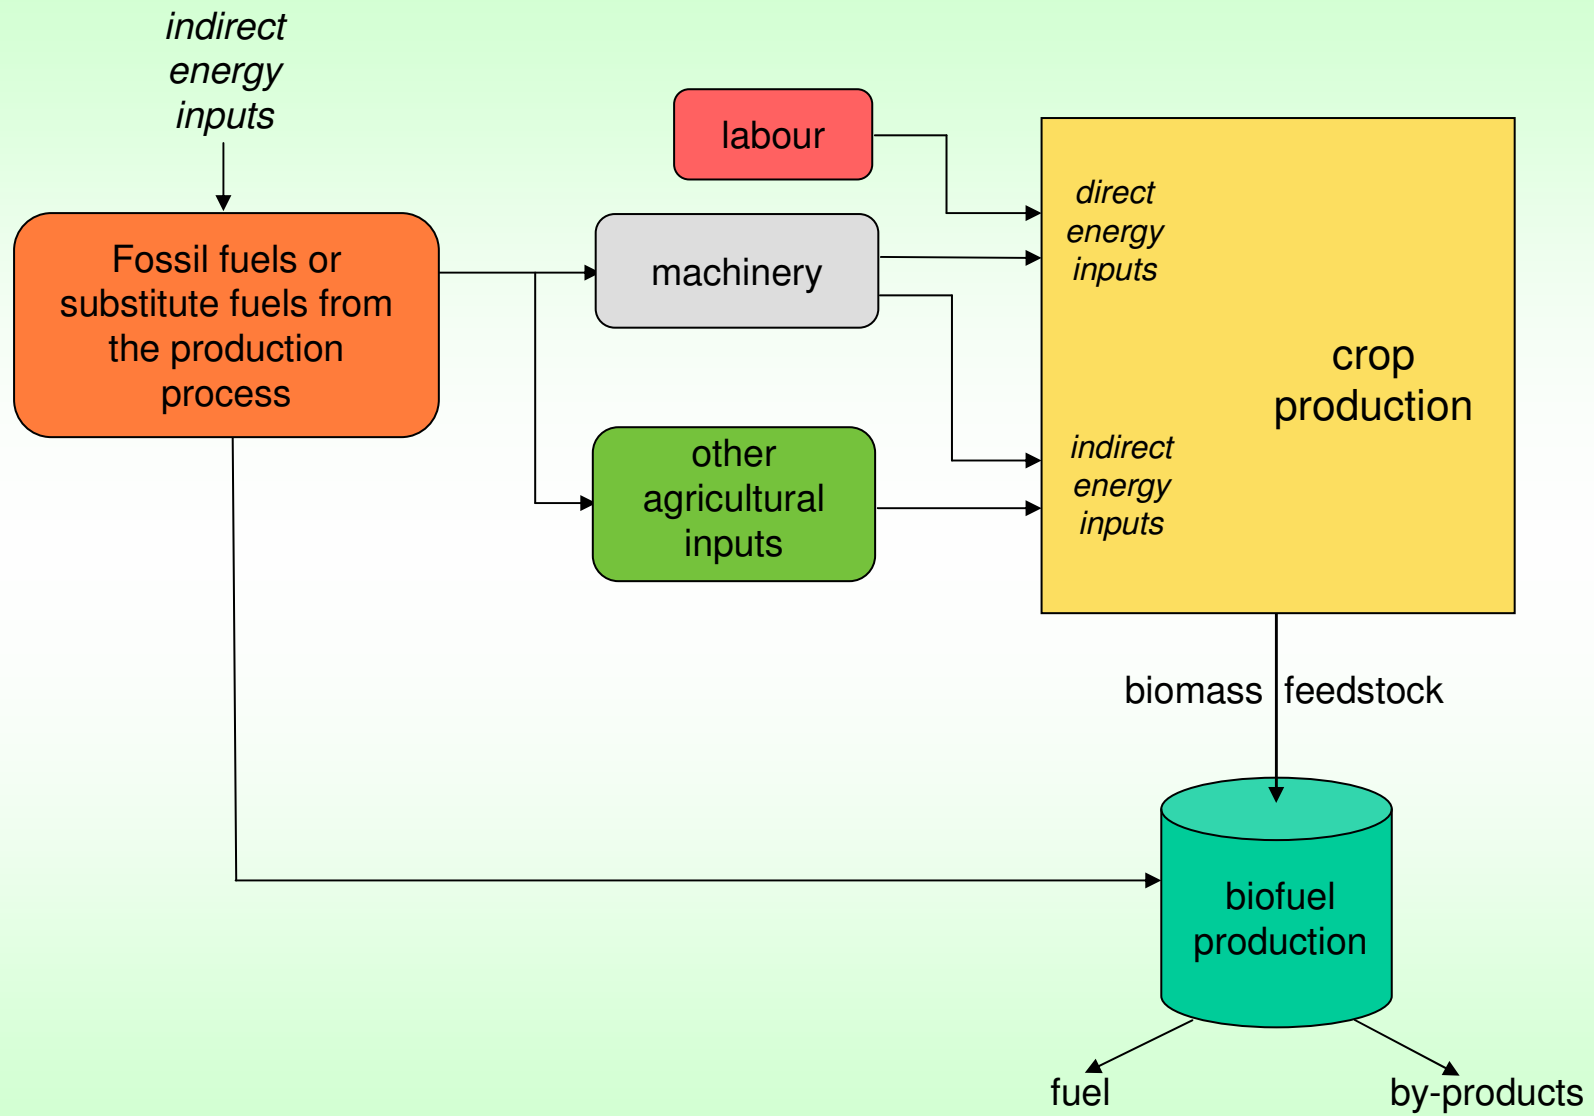

Record: 43 of 95

- Data base of energy inputs into the cultivation of different crop types established
- Factors affecting the energy use in the process have been identified
- Equations developed to account for energy usage in the digestion process
- Energy usage model developed based on typical anaerobic digestion plant configurations and substrates

# Energy balance

- Inputs / outputs
- Direct energy
- Indirect energy
- Energy balance
- Energy ratio

# Energy inputs

# Direct and indirect energy

- Direct energy
  - consumption of energy directly in the production process - includes:
    - fossil fuels
    - labour
- Indirect energy
  - energy which has been used in producing something then used in the production process - includes:
    - fertiliser
    - pesticides / herbicides
    - machinery

# Direct & indirect energy inputs

methane	1,398,655	m <sup>3</sup>
<b>energy value</b>	<b>49,932</b>	<b>GJ/year</b>
	157	GJ/ha

# Digestate

- the digestate is what remains after the biogas has been removed
- it contains most of the nutrients of the original feedstock
- the nutrients are in a form which are more available for crop uptake
- it has a consistency similar to slurry (approx 10% solids)
- it can be separated into solid and liquid fractions

# Effect of digestate use on the energy balance

	value	unit
mineral fertiliser		
crop energy requirement	16.7	GJ/ha
energy for nitrogen	6.04	GJ/ha
<b>total energy requirement</b>	<b>30.1</b>	<b>GJ/ha</b>
digestate fertiliser		
crop energy requirement	9.3	GJ/ha
<b>total energy requirement</b>	<b>22.7</b>	<b>GJ/ha</b>
methane energy value	<b>157</b>	<b>GJ/ha</b>
net energy yield		
mineral	126.9	GJ/ha
digestate	134.3	GJ/ha
